

Rossmond Ralph Q. Rivas

Education

- **B.Sc. Computer Science**, Mapúa Malayan Colleges Laguna, Philippines. 2020–2025

Work Experience

Junior Software Engineer

Payments team

iNeed Solution Inc.

Makati, Philippines

Apr 2025–July 2025

- I created a cross-cutting service that logs events of other modules.
- Comprehensive logging seamlessly integrated with other modules that need their events tracked.
- I based my work on Event Viewer from Windows.
- I learned Task Scheduler for automating tasks and IIS for hosting APIs.
- I implemented security features by using JSON Web Token and implementing an OTP service.
- Development involved usage of C#, Flutter, and MongoDB.
- Insomnia tool was used for testing our API.

Skills

- Languages: C#, Dart, Ruby, Python, Lua, C, PHP
- Frameworks: Flutter, ASP.NET, Ruby on Rails
- Databases: MySQL, MongoDB, Git
- Classes: Software Engineering, Data Structures, Algorithm Design, Database Management Systems
- Certificates: Introduction to NoSQL, Introduction to Cryptography, Employability Skills - JobReady

Projects

- **Parking Reservation System Logger** - During my time with iNeed Solution Inc., I worked on a development of an API. Through creating a logger, I learned how a parking reservation system works. I was able to see both sides of a client-ready product: One from the perspective of parkers and another from the perspective of parking lot owners. Through this project, I also learned the importance of communication since I have to talk to other teams to ensure that the logger works with their modules. My part here is the backend of the project.
- **Istorya Adventure** - A thesis project, this mobile digital game-based learning tool enables elementary students to learn Philippine history through engaging roguelike and bullet hell gameplay. It leverages engaging game elements to keep students learning like level replayability and a leaderboard. This project was made with Unity.
- **Book-A-Seat** - A seat reservation system enabling MMCL students to reserve seats just by scanning a QR code. This eliminates the need of filling up manual information each time a reservation is being made, a pain point in the current system. It also has a tool for the admins of the library where they could rearrange seats digitally, letting the system be flexible replicating physical seat arrangements. I contributed to the frontend with HTML and CSS.
